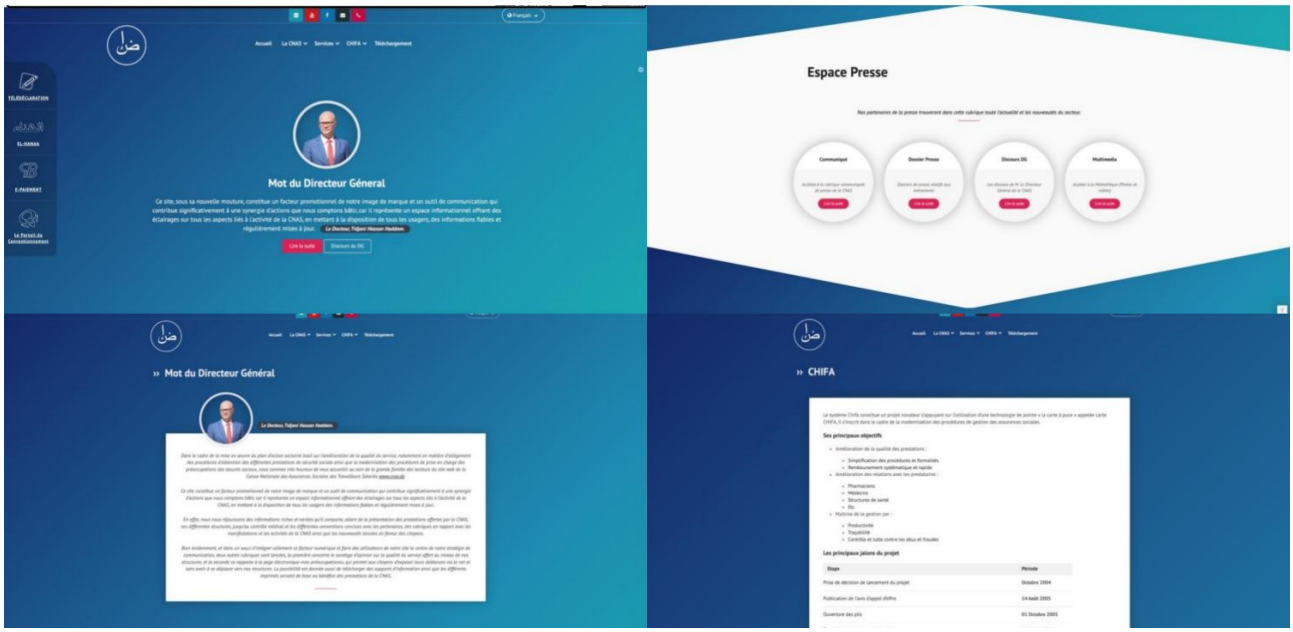
CNAS — National Social Insurance Fund for Salaried Workers

Designed and developed the official website for the CNAS (Caisse Nationale des Assurances Sociales des Travailleurs Salariés), Algeria's national social insurance fund for salaried workers. The platform serves as both a brand communication tool and an informational hub, providing citizens with reliable, regularly updated information on all aspects of the fund's activity.

Key sections include a Director General's message, a dedicated Press Space (press releases, DG speeches, multimedia), as well as the CHIFA smart-card system — a modernization project aimed at improving social insurance management through simplified procedures, systematic reimbursement, and better coordination with healthcare providers (pharmacies, doctors, and health structures).

CNAS (National Social Insurance Fund for Salaried Workers)



Arracom — Ministry of Labor, Employment & Social Security

Built the Arracom platform for Algeria's Ministry of Labor, Employment and Social Security. The platform enables citizens, employees, employers, students, researchers, experts, retirees, unions, associations, and civil society representatives to actively participate in the modernization of social dialogue.

Features include a suggestion submission module, a survey/questionnaire system, and a real-time statistics dashboard displaying breakdowns by employment status, professional situation, education level, gender, and age — giving policymakers actionable insights from a wide cross-section of the population.

Arracom

Huawei Mobile App — Client Loyalty Points (2015) · Apache Cordova

Developed a cross-platform mobile application for a Huawei local promotional event, built with Apache Cordova. The app implements a customer loyalty points system allowing users to log in, view their accumulated points, browse available products, and redeem points for gifts and vouchers from partner brands (Ardis, Carrefour, Uno, Ray-Ban, Hermès, and more).

Screens covered: login and registration, a home dashboard with dedicated sections for account, products, points, gifts, and history, plus a full gift redemption catalog with point costs displayed per item.

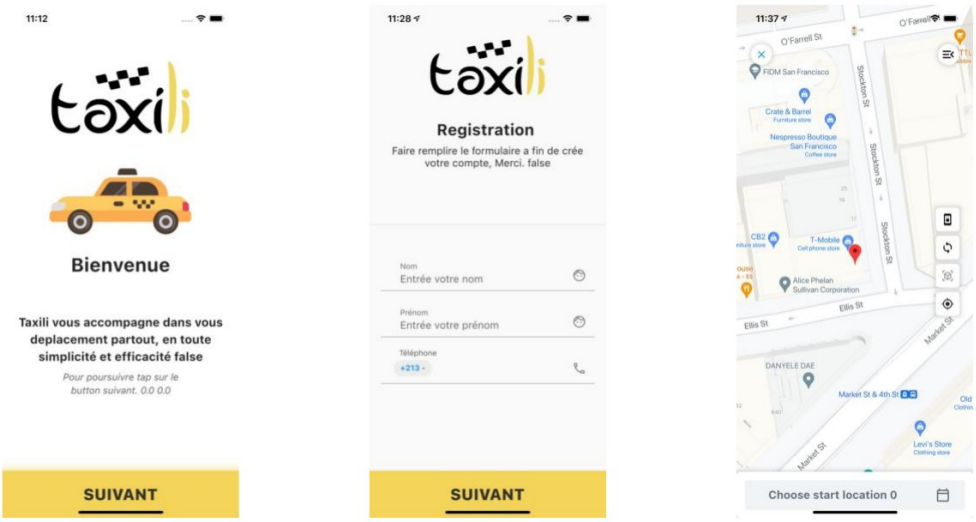
HUAWEI MOBILE APP 2015 FOR LOCAL EVENT (Clients Points) CORDOVA

Taxili — Ride-Hailing Driver App (2021) · Flutter

Designed and developed a Flutter-based ride-hailing application for the local market. The app guides drivers through a smooth onboarding flow: a welcome screen, a multi-step registration form (name, first name, phone number with Algeria country code), and an interactive map view for selecting pick-up start locations.

The UI features the Taxili brand identity with a warm yellow and black color scheme, clean typography, and an integrated map powered by location services — enabling drivers to manage trip assignments efficiently.

TAXILI DRIVING APP 2021 FOR LOCAL - FLUTTER



Official Website — Prime Minister's Office (2020) · Drupal 8

Developed the official web portal for Algeria's Prime Minister (Portail du Premier Ministre) using Drupal 8. The bilingual site (Arabic / French) features a clean governmental design with the national emblem and flag prominently displayed.

The portal provides citizens and media with access to the latest news, official statements, government documents, and multimedia resources. Navigation sections include: Home, Prime Minister, Government, Media, and Documents — all structured for accessibility and regularly maintained by ministry staff.

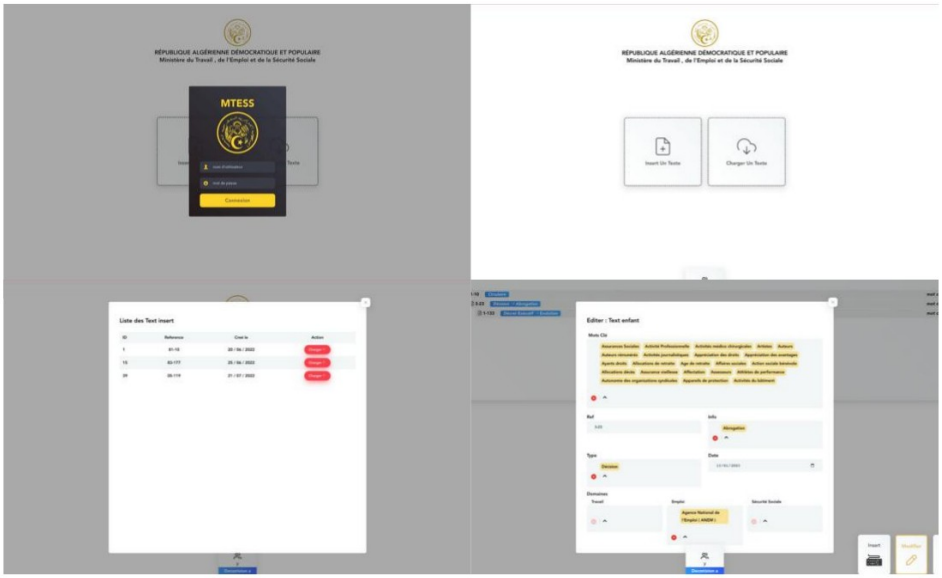
WEB SITE 2020 FOR PREMIER MINISTER - DRUPAL 8

Law Document Management — Internal User Interface

Built a secure internal interface for managing legislative and regulatory texts on behalf of Algeria's Ministry of Labor, Employment and Social Security (MTESS).

The system allows authorized internal users to insert, upload, edit, and organize law documents categorized by edition, domain of application, and legal type. The interface leverages several custom UI components built from scratch, including modal pop-ups, single and multi-select dropdowns, keyword tag selectors, date pickers, and inline document editors — all designed to streamline the daily workflow of legal administrators.

***Law internal users interface**: they can manage law documents based on theirs edition, application and other, used many of my components Popup,Single/multi dropdown*

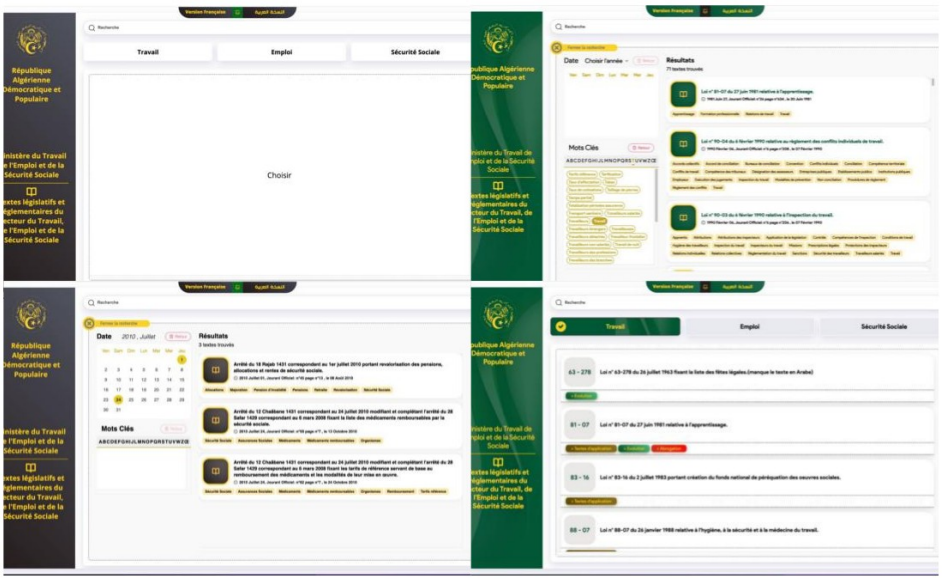


Law Online — Public Client Interface

Designed and developed the public-facing interface of the legal text platform, giving citizens and professionals access to Algeria's legislative corpus across three main domains: Labor (Travail), Employment (Emploi), and Social Security (Sécurité Sociale).

Users can browse by category, perform full-text searches, filter results by year, date range, or keyword tags, and view structured law entries with their official journal references. The bilingual interface (Arabic / French) makes it a practical research tool for legal professionals and compliance teams alike.

***Law Online client interface**: where they can interact with main sections Labor, Work and Social security or by search text or filtering by date, tags.*



Query Maker — Encrypted SQL Query Automation Tool

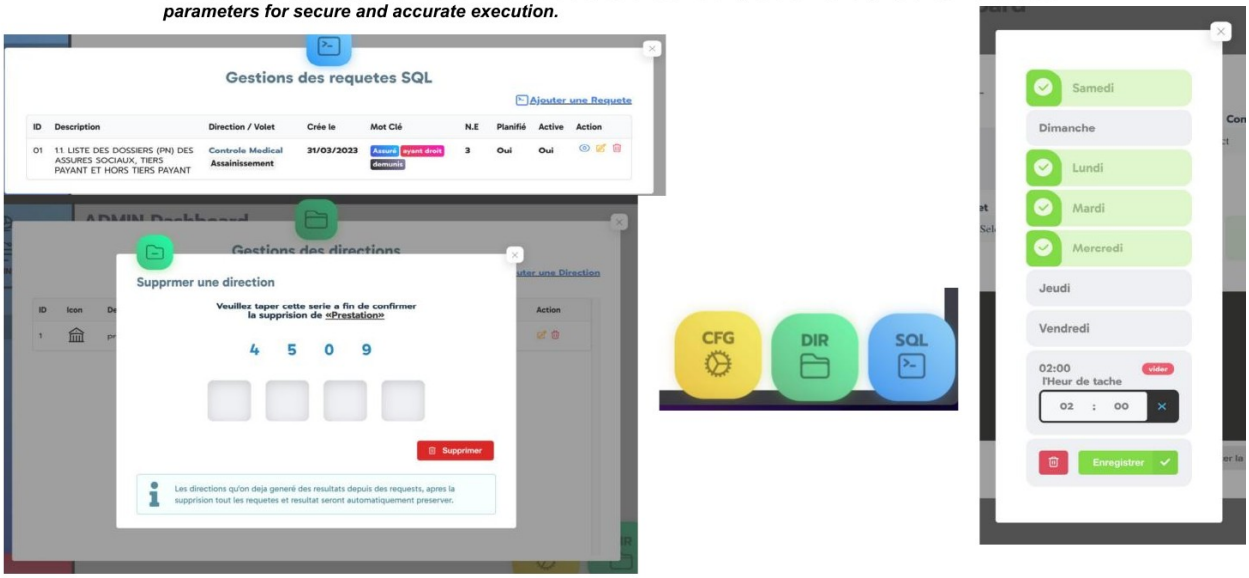
Developed a full-featured internal tool to automate the secure execution of encrypted SQL queries within the CNAS healthcare administration ecosystem. Key capabilities:

- Client-Specific Execution: identifies the correct client context and processes queries accordingly.
- Result Presentation: displays query results in a structured table with direct Excel export.
- Dynamic Database Structures: supports dynamically generated schemas and per-user configurations.
- Preconfigured & Secured Parameters: users can only execute pre-approved queries with locked parameters, preventing unauthorized data access.

The admin dashboard includes direction management, scheduled task configuration with day and time pickers, and a randomized PIN confirmation step before any destructive action is performed.

Developed a Query Maker tool to automate executing encrypted SQL queries. Key features include:

1 - Client-Specific Execution: Identifies and processes queries for specific clients.
2 - Result Presentation: Displays query results in tabular format, with an option to export directly to Excel.
2 - Dynamic Structures: Supports dynamically created database structures and user configurations.
3 - Preconfigured Query Parameters: Ensures that users receive only authorized SQL queries with pre-set parameters for secure and accurate execution.



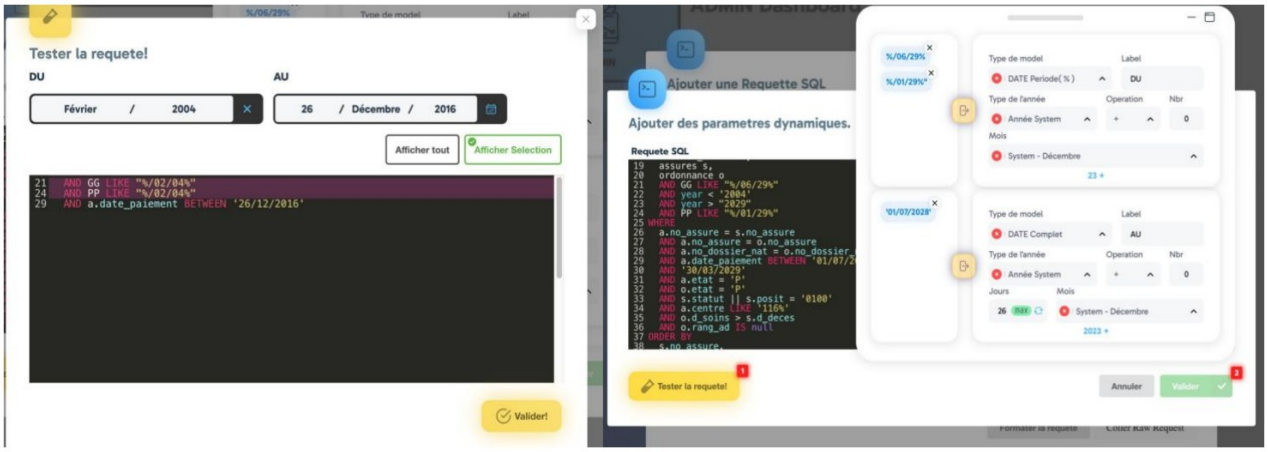
Query Maker — SQL Builder UI & Dynamic Parameter Configuration

Designed and developed the complete front-end application for the Query Maker tool, including a rich set of custom UI components built from scratch:

- An interactive SQL query tester with live date-range input (day / month / year pickers) and an inline query preview with syntax highlighting.
- A dynamic parameter builder allowing admins to define query variables (DATE_PERIOD, FULL_DATE, etc.) with configurable year type, operation, offset, and month — generating parameterized placeholders automatically injected into the raw SQL.

The tool bridges the gap between technical SQL complexity and non-technical administrators, enabling safe, scheduled, and auditable query execution across the organization.

Developed and designed the entire application, including numerous UI components such as pop-ups, date and time pickers, weekly task management features, and more.



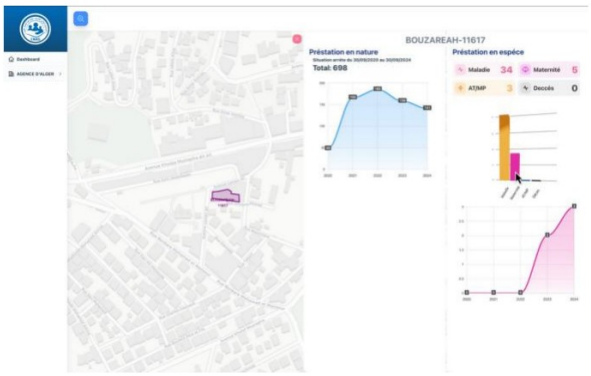
Service Status Dashboard · Node.js / React / RethinkDB

A rapid-delivery internal dashboard enabling CNAS directors to monitor the real-time status of pending healthcare services across all payer centers in the Algiers region.

The tool renders an interactive map of Algiers with all sub-agencies plotted by geographic location. Selecting a center (e.g. BOUZAREAH-11617) expands a detail panel showing pending service counts broken down by type: illness (Maladie), maternity (Maternité), workplace accidents (AT/MP), and death (Décès) — covering both in-kind and cash benefits, with time-series charts for trend analysis.

Built with Node.js (Express, bcrypt, jsonwebtoken), React, and RethinkDB for real-time data streaming.

A quick project developed to generate dynamic queries, enabling the director to view the status of various pending services across different payer centers. The tool allows for detailed monitoring of hold statuses for each service type within substructures, ensuring clarity on pending files (service type and cash). The project was implemented using Node.js (Express, bcrypt, jsonwebtoken, etc.), React, and RethinkDB. (shared only 1 screens)



AQ8 Wonder — Sports & Wellness Mobile App · Flutter

Freelance project: designed and developed a complete Flutter mobile application for AQ8 Wonder, an Algerian company importing and distributing German electrostimulation equipment focused on fitness and facial beauty.

The app covers the full user journey: onboarding and plan selection, login and registration with Google Auth integration, fitness center selection by region (Ouled Fayet, Birkhadem, Blida, Tlemcen…), session pack selection, booking calendar with an interactive date picker, and a booking confirmation screen with email notification.

The design follows a bold red, black, and white brand identity with strong typographic hierarchy and clear call-to-action flows throughout.

Freelance mobile app for a company representing international sports equipment, importing products from Germany, with a focus on weight loss and facial beauty. Designed and developed using Flutter and integrated with Google Auth.

A Glimpse into My Personal Projects

A curated selection from my personal treasury of side projects and experiments — work I built out of curiosity, passion, and a drive to push beyond client briefs. Just a few gems I'd like to share.

A little glimpse into my personal treasury of works—where I showcase what I consider the best of my personal projects. Just a few gems I'd like to share with you!

Jelly — A Lightweight, High-Performance Node.js Web Framework

Built Jelly, a custom raw Node.js web framework designed for maximum throughput and minimal overhead. Benchmarked head-to-head against Fastify, Jelly achieved comparable or better results — averaging ~33,337 req/sec vs Fastify's ~16,587 req/sec on a MacBook Pro 2017 (16 GB RAM, 3.2 GHz i7) under identical load conditions (100 connections, 10 pipeline factor, 40-second test runs).

Core features include: a flexible routing system, static file serving, dynamic virtual file serving (files on disk served as if under /public without exposing real paths to the outside), an optimized body parser, clean CORS handling, and an intuitive request/response pipeline.

Built with raw nodejs web framework called Jelly and did benchmark against the fastify, is lightweight and fastest node js framework; for build faster APIs.
Jelly is in blue and fastify in red, did these couples of times pretty much same result on a macbook pro 2017/16gb ram and 3.2ghz i7

Jelly Store — Lightweight Frontend State Management Library

Developed Jelly Store, a minimal yet powerful frontend state management library for React — designed as a simpler, more intuitive alternative to Redux.

Jelly Store supports creating named stores, adding reducers, and dispatching state updates across any component in the tree — without prop drilling or complex boilerplate. Any component can subscribe to a shared store and react instantly to state changes, as demonstrated by the counter syncing simultaneously across App.jsx, Component1, Component2, and Button.jsx.

Jelly store is a simple frontend store state management like redux but so much easier and better, its does support adding reducers and dispatch function.

```
rc > components > Button.jsx > Button
import jellyStore from '../jellyStore.js';
import Card from '../components/Card';

export default function Button() {
    const countStore = jellyStore.getStore('count');
    return (
        <Card title="from Button.jsx file." value={countStore.value} >
            <button onClick={() => countStore.set(el => el += 1)} clas
                Incement Button
            </button>
        </Card>
    )
}
```

```
sx > default
import jellyStore from './jellyStore';
import Card from './components/Card.jsx';
import Component1 from './components/Component1.jsx';
import Component2 from './components/Component2.jsx';
import Button from './components/Button.jsx';
const  App =()=>{
    const countStore =  jellyStore.createStore('count', 0);

    return(<>

        <div className='flex gap-4'>
                <Card title="from App.jsx file." value={countStore.value}/>
                <Component1/>
                <Component2/>
                <Button />
        </div>

    </>)
}

export default App;
```

< THANK YOU />

Proud winner at the Algeria Web Awards (AWA) — recognized for delivering outstanding digital experiences for public institutions and enterprise clients across Algeria.
